

The logo is a large, stylized letter 'B' in a light grey color. Inside the central negative space of the 'B', there is a solid purple triangle pointing towards the left. The background of the slide is white with faint, light blue circuit-like lines and dots in the corners.

BEACON INNOVATION HUB COURSE COMPETENCE SUMMARY WEEK ONE.

Compiled: by MR S MHLOPHE

QUESTION 1: What specific technical capability, architectural pattern, or system configuration from your coursework did you validate or deploy since our last sync? (What activities did you do this week?)

This week I completed Module 1 of the Introduction to Software Engineering course. I learned about the Software Development Life Cycle (SDLC) and the different stages software projects go through, requirements gathering, design, development, testing, deployment and maintenance. I also learned about different software development methods including Waterfall Model, V-Model and Agile development methodology. I learned one important point, the methodology used for development can affect the planning, development, testing and adaptation of a project to changing needs. Just to show how I am doing I finished the Module 1 lessons and the graded quiz on the Software Development Lifecycle. To show how I am doing I finished the Module 1 lessons and the graded quiz on the Software Development Lifecycle

QUESTION 2: What blockers are affecting your progress, and what support do you need?

Managing to balance the course with my university workload and BIH commitments and being lazy and being on my phone + the internship program I got. I can get through the course but it's hard to stay on top of the time regularly. At this point I don't have any software blockers except for the fact that I'm doing the theoretical part of this course, not practical part only. The biggest thing I need is accountability to keep me on track with progress through the course.

QUESTION 3: What measurable task or test will you complete before next stand-up?

I will have finished the Introduction to Software Engineering course Modules 2 and 3 and their examinations.

For the practical demo, I will pick a small software project and show how the principles from Modules 2 and 3 can be applied. I'll create a simple project workflow to show the requirements, development, version control and testing stages
